Education

Example State University Springfield, ST
B.S. Computer Science | Minor in Statistics *Expected May 2027*

- **Awards:** Dean's List, Example Engineering Scholarship, Hackathon Finalist
- **Relevant Coursework:** Operating Systems, Distributed Systems, Algorithms, Databases, Computer Networks, Machine Learning

Experience

Acme Cloud Inc. Jun 2026 – Aug 2026
Software Engineer Intern — Developer Platform *Remote*

- **Build Cache:** Cut median CI time from 22 min to 6 min across 140 repositories by building a content-addressed dependency cache in Go backed by S3, keyed on lockfile hashes so unchanged services skip reinstalling their packages entirely. Chose a hash-keyed store over a time-based cache after stale entries caused two false-green builds in the prototype.
- **Flaky Test Triage:** Brought the nightly failure rate for the integration suite from 18 failures per week to 4 by writing a Python service that reruns failures in isolation, tags nondeterministic tests, and files an issue with the last three failing logs attached for the owning team.
- **Deploy Dashboard:** Reduced time-to-diagnose for failed deploys from roughly 15 minutes to under 3 by implementing a React and FastAPI dashboard that joins deploy events, Kubernetes pod status, and recent commits into one timeline view.

Northwind Analytics Jan 2026 – May 2026
Data Engineering Intern *Springfield, ST*

- **Warehouse Pipeline:** Cut the daily sales-report refresh from 3 hours to 25 minutes for 40 analysts by rewriting a sequential Python ETL job as partitioned SQL transformations in PostgreSQL with incremental loads, validated against a week of production data with zero row-count mismatches.
- **Data Quality Checks:** Caught 31 schema-drift incidents in the first month by adding automated column-type and null-rate checks to the ingestion step, with alerts routed to the owning team's Slack channel.

Example Labs (Research Assistant) Sep 2025 – Dec 2025
Undergraduate Researcher *Springfield, ST*

- **Model Evaluation:** Replaced a manual spreadsheet process with a Python harness that evaluates 12 classifier variants on 5 datasets in under 20 minutes, producing reproducible confusion matrices and calibration plots with scikit-learn and Matplotlib.

Projects

Tiny Key-Value Store *Rust*

- **Storage Engine:** Built a log-structured key-value store in Rust with a write-ahead log, memtable flushes to sorted files, and background compaction, sustaining 80K writes per second on a laptop in a single-node benchmark.

Log Search Tool *Go, SQLite*

- **Indexing:** Cut search latency on 2 GB of application logs from 9 seconds with grep to 120 ms by building an inverted index in SQLite FTS5 with a Go command-line front end, and shipped it as a single static binary used by 15 classmates during a capstone project.

Leadership

Example State Computing Club Sep 2024 – Present
Workshop Lead *Springfield, ST*

- **Teaching:** Taught a 6-week Git and Linux workshop to 45 first-year students, rewriting the exercises after week 2 when a survey showed 60% were stuck on merge conflicts, which raised completion of the final lab from 52% to 84%.

Technical Skills

Languages: Python, Go, Rust, SQL, JavaScript
Frameworks & Tools: React, FastAPI, PostgreSQL, Kubernetes, scikit-learn, Matplotlib, Slack API
Interests: Distributed systems, Developer tooling, Running, Chess
